GENERAL INTRO- DUCTION

On October 29 of 2019, SeABank received formal regulatory recognition from the State Bank of Vietnam (“SBV”) in achieving, among other things, a satisfactory capital adequacy ratio in line with Basel II, as specified in Decision 2263/QD-NHNN of the SBV. The application of Basel II into SeABank’s business activities delivered a positive impact, in particular:

- The capital adequacy ratio (CAR) now forms part of SeABank’s risk appetite and is a key basis for implementing business plans and risk management in the short and medium term.
- Business units are improving customer data (such as financial statements of SME customers, collateral security and credit limits, etc.).
- Improved awareness of business units in reviewing and granting credit limits to customers.
- Clear understanding by the Board of Management of capital adequacy

requirements for risk provisions, including regulatory capital (stipulated in Circular 41 for credit risk, market risk and operational risk) and other material risks (stipulated in Circular 13 for interest rate risk in banking book, concentration risk, etc.).

Scope of disclosure

This report is made as at June 30, 2024 and is made in accordance with Circular 41/2016/TT-NHNN dated December 30, 2016 stipulating capital adequacy ratio and information disclosure requirements for commercial banks and the foreign banks’ branches.

Scope of capital adequacy ratio calculation

Consolidated CAR is calculated on the basis of the consolidated financial statement of SeABank and its subsidiaries, which are SeABank Asset Management Company Limited (SeABank AMC) and Post & Telecommunication Finance Company Limited (PTF Vietnam) which is 100% owned by SeABank and has no insurance business subsidiary. Both companies financial statements are consolidated in accordance with accounting standards.

Unit: million VND

	Investment Amount	Proportion of ownership (%)
Capital contribution		
1. SeABank Assets Management One Member Company Limited	1,000,000	100%
2. Post and Telecommunication Finance Company Limited	1,760,000	100%
TOTAL	2,760,000	

CAPITAL ADEQUACY RATIO

Process of calculating the capital adequacy ratio

SeABank has issued an internal regulation managing its capital adequacy ratio (“CAR”) in line with Circular 41, to provide the CAR principles, CAR model management, requirements of SeABank’s IT system and the responsibilities of stakeholders in CAR measurement, monitoring and reporting.

The CAR calculation system of SeABank is automated on the basis of data extracted from the core banking system. Data for CAR calculations is regularly reviewed and collated to ensure accuracy. The CAR report is also reviewed and approved before being issued.

CAR calculation process include 3 steps:

- Collecting and validating data;
- Automatic calculation in the system;

- Analysis reporting, providing results, and archiving.

Capital plan

SeABank’s capital plan is built in accordance with the capital requirements of Circular 41 to ensure capital adequacy so that it can:

- Meet requirements in terms of SeABank’s own risk appetite and commitments;
- Successfully comply with the minimum 8% CAR stipulated by legal regulations to ensure stable implementation of business strategies.
- Allow SeABank to operate with stability, even during periods of recession or adverse market volatility.
- Be aligned with the strategic and operational targets of SeABank, the expectation of shareholders and investors.

Unit: million VND

Table 1: Capital adequacy ratio & Risk-weighted assets

	SEPARATE	CONSOLIDATED
(1) Total of tier-1 capital (after deduction)	32,764,212	32,466,045
(2) Total of tier-2 capital (after deduction)	(582,264)	(558,900)

Tier-1 capital adequacy ratio	15.08%	15.03%
Capital adequacy ratio (CAR)	14.00%	14.78%

EQUITY

Components of equity:

According to SBV regulations, SeABank's own capital is divided into two main types: Tier 1 capital and Tier 2 capital, based on the holding time and the ability to absorb capital losses.

Tier 1 capital – Equity consists primarily of equity and published reserves. There is no obligation to pay interest periodically or dividends to shareholders of this type of capital. Equity can be used immediately and without limitation, to offset any risks or losses.

Tier 2 capital – Additional capital sources include: (1) Other reserve funds deducted from

profit after tax, (2) 45% of the capital increase due to revaluation of long-term investment capital contributions, (3) 50% of capital increase due to revaluation of fixed assets, (4) 80% of general provisions under the SBV's regulations on classification of assets, deduction levels, methods of making provisions and using risk provisions, (5) Capital debt instruments issued by the Bank, and (6) Subordinated debt signed by the Issuing Bank that fully satisfies the conditions of the SBV.

Equity instruments: SeABank has not yet issued any equity instruments.

RISK MANA- GEMENT

SeABank has built a system of risk management policies, regulations and procedures to manage risks that complies with Basel II, is consistent with the orientation of the SBV, which SeABank's specific requirements.

SeABank has a comprehensive suite of risk management policies covering risk appetite, risk management strategy and material risks. SeABank's risk management policies are approved by the Board of Directors, with participation of management levels based on consideration of (1) the interests of shareholders, owners, and capital contributors; (2) SeABank's capital and future available sources of capital, and (3) adaptability to ensure feasibility across economic cycles. SeABank's risk management policy is established for a minimum period of 3 years

but not more than 5 years and is reviewed at least annually unless a more immediate review is required by a change in the legal and business environment.

SeABank's risk appetite indicates the extent to which it accepts each of the material risks.

SeABank's risk appetite ensures its ability to integrate and align with the bank's strategy, including business strategies, risk strategies and financial plans in both the short and long term as well as evaluate business performance.

The list of material risks is determined and established by SeABank on a bank-wide basis, ensuring critical risks (including credit risk, operational risk, market risk, liquidity risk, account risks, central bank interest rates, concentration risks) and other risks arising from essential activities are fully identified, accurately measured, regularly monitored for timely prevention and minimize the losses to SeABank.

CREDIT RISK

Credit risk is the risk that customers (including credit institutions and foreign bank branches) fail to perform part or all of their debt payment obligations under a contract or agreement with SeABank. This includes obligations to make payments via trusts, deposits and debt issuances.

Counterparty credit risk is the risk that a counterparty fails to perform or is unable to perform part or all of the payment obligations prior to or upon the maturity of proprietary dealing transactions; repo and reverse repo transactions; derivative trading products to manage risks and foreign currency transactions. In particular, counterparties are customers (including credit institutions and foreign bank branches) having transactions with SeABank in repo and reverse repo; derivative hedging products and trading foreign currency /financial asset to serve the needs of customers and counterparties.

Credit risk management is implemented during the appraisal, approval and credit portfolio review to ensure compliance with the provisions of the law, the SBV and SeABank.

SeABank has developed a credit risk management strategy that includes at least the following:

- Target non-performing loans (NPL) ratio, target credit extension ratio by type of customer, industry and economic sector.
- Principles to determine the cost of credit risk offset in the method of calculating interest rates, pricing credit products according to the customer's credit risk level.
- Principles of application of credit risk mitigation measures (including the competence to approve credit risk mitigation measures).

Measuring and assessing credit risk plays an important role in managing credit risk in SeABank. SeABank has developed quantitative and qualitative tools to measure the risks existing in the credit portfolio, creating a basis for credit risk management, control and adjustment.

RWA results by rating

SeABank uses the credit ratings of the three independent credit rating agencies: - Fitch Ratings (FITCH), - Moody's Investor Service (MOODY'S), - Standard and Poor's (S&P), base on some following categories:

- Using the effective agreement of the credit rating results and updated at the time of reporting.

- In case the customer/partner has two or more credit ratings of credit rating agencies, the credit rating corresponding to the highest credit risk of customers/partners will be used.

MARKET RISK

Market risk policy

SeABank's market risk is primarily managed across two business divisions:

(1) Treasury, and (2) Investments. Market risks arising from other business units must be transferred to the market risk department. In addition:

- Financial markets products and instruments ("FMPI") must have accounting and recording regulations in either the banking book or trading book to ensure that market risks arising from the trading of FMPI is appropriate and fully recorded on a daily basis.

- Market risk in FMPI in the trading book is managed in stages. This includes: (1) identification, (2) measurement and risk mitigation, and (3) monitoring and supervision. Furthermore, proprietary trading of FMPI is managed in accordance with the three lines of defense (3LOD) methodology.

- Market risk appetite is developed and re-evaluated annually in parallel with the reassessment of market risk limits for each proprietary trading portfolio.

- The proprietary trading portfolio must be quantitatively measured and formulated stress test scenarios must clearly show the level of market risk that SeABank holds.

- An early warning system has been developed to identify and mitigate market risks.

Proprietary trading strategies & Portfolios

SeABank manages proprietary trading portfolios which include: (1) foreign exchange, (2) government bonds, and (3) corporate bonds. In particular, it is noted that:

- SeABank manages market risk in foreign exchange by limiting trading in G7 currencies (primarily USD) via setting of appropriate risk limits.

- SeABank also manages interest rate risk by limiting trading to short to medium-term, highly liquid government and corporate bond exposures.

Unit: million VND

Table 10: Regulatory capital for Market Risk

	Separate		Consolidated	
	RWA	Capital required	RWA	Capital required
Interest rate risk	4,936,038	394,883	4,936,038	394,883

Commodity price risk	-	-	-	-
Foreign exchange risk	2,214,816	177,185	2,214,816	177,185
Option price risk	-	-	-	-
TOTAL	7,150,854	572,068	7,150,854	572,068

OPERATIONAL RISK

Operational risk is the risk due to incomplete or erroneous internal processes, human factors, system failures, faults or external factors that cause financial losses. The main negative impacts were non-financial impacts on SeABank (including legal risks). Operational risks do not include reputational and strategic risks.

SeABank has developed an operational risk management policy that covers the following:

- Principles of operational risk management.
- Principles for outsourcing, insurances and application of technologies.
- Business continuity planning.

SeABank fully identifies operational risks in all products, business activities, business

processes, information technology systems and management systems.

SeABank strictly manages outsourcing activities to ensure the use of outsourced services does not cause dependence, does not compromise the security of SeABank's database and customer information and is more effective than self-implementation. The business continuity plan has been developed to meet SBV requirements and covers a number of scenarios such as loss of important documents and databases; malfunctioning of information technology systems and force majeure events, such as natural disasters and fires. The business continuity plan focuses on those key activities which may significantly impact the bank's capabilities if compromised, such as payment systems, communications and treasury.
